

Kosco Customers Make Small Investment To Reduce Heating Costs

As usual, Kosco technicians have been busy performing routine service calls and Premium Tune-ups to service plan customers. Not so usual is the number of new installations of a unique device that does not cost a lot and can reduce fuel usage by as much as 20%. For those home that are using 1000 gallons of fuel each year a 20% reduction could save over \$450 in the first year.

Mike Berardi of Kosco stated that the HeatManager™ fuel economizer is the newest advance in boiler controls for residential boilers. It works with any fuel, and improves hot water home heating systems. And, it's *guaranteed* to reduce heating fuel consumption by at least 10%!

Beckett HeatManager™ boiler controls improve the efficiency of most gas, oil, or propane-fired residential boiler home heating systems, resulting in fuel and energy savings. It automatically adjusts the burner run pattern to match the system's heat load, substantially improving efficiency. You will experience lower gas, propane and heating oil bills, while improving boiler efficiency.

The HeatManager™ boiler control adds patented, state-of-the-art microprocessor technology to the boiler to optimize the overall heating system efficiency. When installed on a new or existing boiler heating system, HeatManager™ boiler controls reduce fuel consumption, wear on parts, flue emissions, and electrical usage.

Berardi explained that this unique device can be installed quickly and affordably, given the savings associated with the reduction in fuel usage. The statement “Lower heating bills are *guaranteed!*” can be found on the Becket HeatManager website. You will experience a savings of 10 to 20% in heating fuel usage with the Beckett HeatManager™ boiler control.

One Kosco technician pronounced that every homeowner should make his or her home more comfortable and energy-efficient, “that’s what Kosco is all about”.

Berardi said that the HeatManager™ uses the newest technology in boiler controls for saving fuel and money with residential hot water heating systems. He explained that it could be installed on most boiler-type heating systems. “To maximize this years savings, summer and fall is a good time to get one installed”.
